Host Type: All kinds of server hosts for net site, games, chat, music, film etc.

Bandwidth Support: 100M and 1000M.

Hardware Requirements: Intel P4 2.4; DDR 1G EMS memory; Intel, 3Com
or other high quality Internet adapter.

FoRTGuard

Installation notes:

FortGuard firewall can run stably on Windows 2000 Server and Windows 2003 Server systems. To avoid conflict, please ensure that neither other firewall software nor hook anti-virus software is installed. In fact, other types of packet filtering firewall can not contribute to anti-DDoS. Some can even put heavy burden to the system. For the same reason, hook antivirus software will degrade system performance severely and affect system stability negatively.

In another word, do not install on the server with security software only suitable for individual PCs. If you are lack of confidence in the security of your servers, feel free to contact us for help. Our security engineers will provide you with free advice.

Upgrade installation:

Uninstall the old version of FortGuard Anti-DDoS firewall first, and restart you system.

Install the new version, and restart the system to use the updated firewall for Windows 2000 Server system.
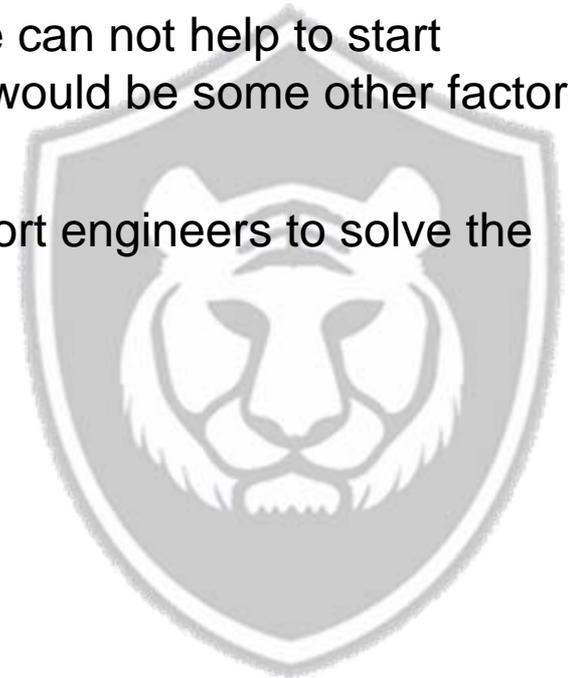

For the Windows 2003 Server system, no need to restart the system to start FortGuard Anti-DDoS firewall.
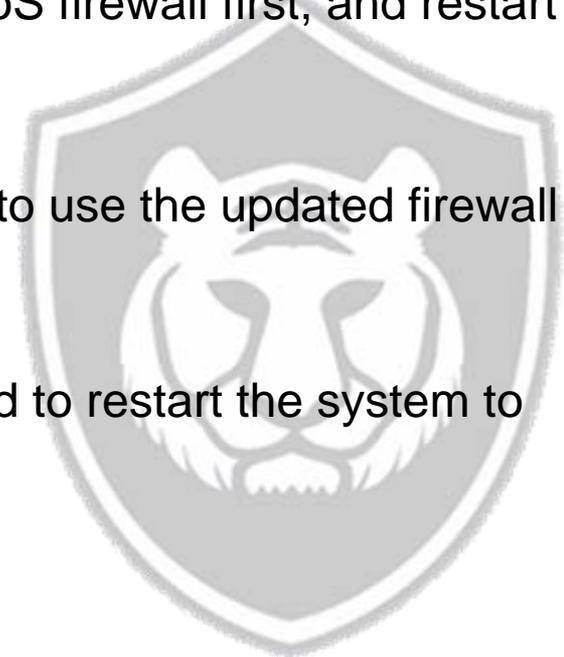

Failure in installation:

It is most likely caused by the conflict between FortGuard and other security software. If unloading other security software can not help to start FortGuard DDoS Firewall successfully, there would be some other factors.

 Please feel free to contact our technical support engineers to solve the problem.
